Final Report, 2002, for Contract No. F49620-99-1-0203.

Dear Arje,

Please find below my Final report for Contract No. F49620-99-1-0203.

Please confirm the receipt of the message.

Thank you, Alex Figotin.

Final Report, 2002, for Contract No. F49620-99-1-0203.

- 1. Title: ''Tunable Photonic Crystals''.
- 2. AFOSR Contract No. F49620-99-1-0203.
- 3. Finral Report for the period October 1, 1999 May 31, 2002.
- 4. PI Name: Alexander Figotin, Department of Mathematics, University of California at Irvine

Irvine, CA 92697-3875. Phone: 949-824-5506. Fax: 949-824-7993.

E-mail address: afigotin@uci.edu

I. OBJECTIVES.

- 1. Develop time efficient and reliable methods for the computation of the band gap structures for 2D photonic crystals of the general geometry and 3D photonic crystals with cubic geometry. Develop asymptotic theory of 3D thin-film photonic crystals.
- 2. Develop the theory of nonlinear interactions in 1D, 2D and 3D photonic crystals.
- 3. Develop the methods for the computations of the localized eigenmodes and their frequencies generated by the defects in photonic crystals.
- 4. Develop the theory on magnetic photonic crystals. Applications of magnetic photonic crystals.
- 5. Explore the applications of magnetic photonic crystals in submillimeter range of frequencies.

II. STATUS OF EFFORT

- 1. Our initial theoretical work with Dr. Yu. Godin on asymptotic models for 3D thin-film photonic crystals is out. The results establish a possibility of spectral gaps and provide new computational tools for studies of 3D photonic crystals.
 - A. Figotin and Yu. Godin, "Spectral Properties of Thin-film Photonic

Crystals", SIAM J. Appl. Math., 61, No. 6, pp. 2008-2035 (2001).

- 2. We finished our work on nonlinear photonic crystals with quadratic nonlinearity including the role the group velocity matching for nonlinear interactions in periodic media. We can see looking at publications a growing interest to nonlinear periodic dielectric structures, especially with quadratic nonlinearity. We believe that the work we have conducted is an achievement in that area. We learned from the editor that our paper was "one of the most accessed articles for the Journal last year".
- A. Babine and A. Figotin "Nonlinear Photonic Crystals. I. Quadratic Nonlinearity", Waves in Random Media, 11, pp. R31-R102 (2001).
- 3. The work on the development of computationally efficient "Resolvent method" for localized states in 2D photonic crystals of the square geometry is completed. We believe that the proposed method is superior in both the speed and the accuracy of computation.
- A. Figotin and V. Goren, "Resolvent Method for Computation of Localized Defect, Modes of H-polarization in 2D Photonic crystals, Phys. Rev. E, 64, 056623, 2001.
- 4. Our theoretical results on magnetic photonic crystals have been completed and published. The results can have important applications for more efficient and of smaller dimensions antennas.
- A. Figotin and I. Vitebskiy, "Spectra of Periodic Nonreciprocal Electric Circuits", SIAM J. Appl. Math., 61, No. 6, pp. 1959-1979 (2001).
- A. Figotin and I. Vitebskiy, "Nonreciproal Photonic Magnetic Crystals",
- Phys. Rev. E, Vol. 63, pp. 066609-1 -066609-17, 2001
- 6. All the computational work was carried out on our SGI ''Octane'' computers as well as 32 CPU parallel SGI''Origin 2000'' computer.
- Dr. Godin and Dr. Goren have written the codes for the parallel computer and use of the parallel computer became routine.

III. ACCOMPLISHMENTS/NEW FINDINGS.

1. Our work with Dr. Vitebskiy on nonreciprocal (gyrotropic) photonic crystals has shown that one can achieve strong nonreciprocity just by proper arrangements of common and widely available dielectric materials.

Here are the main attractive features of microwave, millimeter, and submillimeter devices utilizing our invention:

- substantially smaller weight and dimensions
- multifold enhancement in power capabilities
- tunability
- excellent survivability
- functionality under harsh external conditions including: temperature, impacts and blows, vibrations, any radiation versatility

The theory of those structures are described in our Phys. Rev. E paper with Dr. Vitebskiy.

2. Our work with Dr. Babine on the nonlinear photonic crystals provides solid theoretical base for the studies of a number on nonlinear regimes in periodic dielectric structures. Based on the Stationary Phase Method applied to oscillatory interaction integrals arising in nonlinear Maxwell equations, we described all important selection rules of stronger nonlinear interactions, and developed a quantitative classification of nonlinear interactions.

In particular, we have shown the for regimes under study the group velocity matching, not the frequency matching (as commonly believed), is the most important selection rule.

IV. FACULTY SUPPORTED:

Dr. A. Babine, Dr. Yu. Godin, Dr. V. Goren and Dr. I. Vitebskiy.

V. PUBLICATIONS and SUBMITTED PAPERS for the reported period:

Facultad de Ciencias, Universidad Autonoma de Madrid, Spain. Theory of spectra of thin-film photonic crystals. July 6, 2000, Yu. Godin.

Fisica I Enginyeria Nuclear, Universitat Politecnica de Catalunya, Spain.
Theory of spectra of thin-film photonic crystals.
July 3, 2000, Yu. Godin.

The Second Irvine Days in Applied and Computational Mathematics,

Calculation of the spectrum of some two- and three-dimensional photonic crystals.

May 14, 2000, Yu. Godin.

Nuclear Research Center Soreq, Israel. Calculation of the spectrum of some two-dimensional photonic crystals. July 14, 1999, Yu. Godin.

Physics Department, Van der Waals-Zeeman Institute, University of Amsterdam, Netherlands. Calculation of the spectrum of some two-dimensional photonic crystals. July 9, 1999, Yu. Godin.

Seminaire de Physique mathematique et Geometrie, Universite Paris 7, France.

Calculation of the spectrum of some two-dimensional photonic crystals. July 7, 1999, Yu. Godin.

Department of Physics, University of Bath, United Kingdom. Calculation of the bandgap structure of some two-dimensional photonic crystals. July 1, 1999, Yu. Godin.

Department of Mathematics, University of Liverpool, United Kingdom. Calculation of the spectrum of some two-dimensional photonic crystals. June 29, 1999, Yu. Godin.

VII. Patents.

We filed the provisional patent application UC Case No. 2001-350-1

"Gyrotropic Photonic Crystal and Applications for the Same" acknowledging the support of AFOSR.

The patent is related to our recent results on magnetic photonic crystals.

VII. INTERACTIONS/TRANSITIONS.

Our work on nonreciprocal and magnetic photonic crystals received an attention from the industry.

We established working relations with Dr. D. Barker from Raytheon, and arranged a meeting with a group of Dr. G. Schultz from Boeing.

We had a meeting with a group of representatives from Raytheon in January 2001 in UCI, Office of Technology Alliances. The subject of the meeting was potential applications of nonreciprocal (gyrotropic) photonic crystals to microwave devices with enhanced performance and of smaller dimensions. It is my impression that Dr. Barker and Raytheon's attorney recognized a significant potential of proposed by us new dielectric structures. UCI provided all necessary documents to establish research partnership with Raytheon.

A similar meeting took place with representatives of Boeing, including Dr. G. Schultz, in Boeing West Hills Laser & Electro Optical Systems.

Dr. Schultz indicated an interest not only to applications of our work to devices of traditional frequencies but also to optical frequency range. This indicates that what used to be just a theoretical possibility

may be today practical enough for utilization in useful devices.
